First, copy the code and save in any name .c

Next by command gcc compile the file such as gcc <yourfilename>/c

While getting output .\a.out <filename.txt> <no.of frames> <method>

(Note the filename must be in form txt, method must be in small letters and there must be only one space gap between arguments)

(Note :- I have converted cache values to long form using atoi so somevalues will be in long integer but when converted to strings they are same and equal).
